

Human-Computer Interaction

Mobile &

Tangible Computing

Professor Bilge Mutlu

Today's Agenda

- » Topic overview: *Mobile & Tangible Computing*
- » Discussion
- » Q&A: *Upcoming assignments, project milestones*

Three Visions

Three visions that have shaped mobile and tangible computing research:

1. **Vision 1:** Communication will be mobile and ubiquitous, facilitated by networked small, handheld devices ➔ *Mobile Computing*
2. **Vision 2:** Computing will be pervasive and embedded within environments, facilitated by specialized, networked, and invisible computers ➔ *Internet of Things*
3. **Vision 3:** Computing will be physical, tangible, and manipulatable by people, facilitated by platforms and props that recognize human intent and expressions ➔ *Tangible Computing*

What is the history behind these visions?

Vision 1: Mobile Computing

Harold Osborne (chief engineer for AT&T) predicted in 1954:¹

Let us say in the ultimate, whenever a baby is born anywhere in the world, he is given at birth a number which will be his telephone number for life. As soon as he can talk, he is given a watch-like device with ten little buttons on one side and a screen on the other. Thus equipped, at any time when he wishes to talk with anyone in the world, he will pull out the device and punch on the keys the number of his friend. Then turning the device over, he will hear the voice of his friend and see his face on the screen, in color and in three dimensions. If he does not see and hear him he will know that the friend is dead.

¹Harold Osborne

Where is the research in mobile computing?

- » **Example 1:** Wish You Were Here (Venolia et al., 2018)
- » **Example 2:** Geocaching with a Beam (Heshmat et al., 2018)
- » **Example 3:** Supporting Elder Connectedness (Kleinberger et al., 2019)

Vision 2: Internet of Things (a.k.a. Ubiquitous & Pervasive Computing)

Mark Weiser (CTO of Xerox PARC) proposed in 1991:³

Ubiquitous computing names the third wave in computing, just now beginning. First were mainframes, each shared by lots of people. Now we are in the personal computing era, person and machine staring uneasily at each other across the desktop. Next comes ubiquitous computing, or the age of calm technology, when technology recedes into the background of our lives.

³Wikipedia: [Mark Weiser](#)

The Computer for the 21st Century:

Ubiquitous computing begins to emerge in the form of live boards that replace chalkboards as well as in other devices at the Xerox Palo Alto Research Center. Computer scientists gather around a live board for discussion. Building board and integrating them with other tools has helped researchers understand better the eventual shape of ubiquitous computing. In conjunction with active badges, live boards can customize the information they display.⁴

⁴ Weiser, 1991, The Computer for the 21st Century

*Principles of Calm Technology*⁵

1. Technology should require the smallest possible amount of attention
2. Technology should inform and create calm
3. Technology should make use of the periphery
4. Technology should amplify the best of technology and ... humanity
5. Technology can communicate, but doesn't need to speak
6. Technology should work even when it fails
7. Right amount of technology = minimum needed to solve the problem
8. Technology should respect social norms

⁵Calm Technology

Where is the research in pervasive/ubiquitous computing?

- » **Example 1:** Wall ++ (Zhang et al., 2018)
- » **Example 2:** Zensors (Laput et al., 2015)
- » **Example 3:** Ubicoustics (Laput et al., 2018)

Vision 3: Tangible Computing

Hiroshi Ishii and Steve Ullmer proposed in 1997:⁶

Humans have evolved a heightened ability to sense and manipulate the physical world, yet the GUI based on intangible pixels takes little advantage of this capacity. The TUI builds upon our dexterity by embodying digital information in physical space. TUIs expand the affordances of physical objects, surfaces, and spaces so they can support direct engagement with the digital world.

⁶Ishii & Ullmer, 1997, Tangible Bits

Reactable tangible interface:⁷

The Reactable is a new electronic musical instrument with a simple and intuitive design, which enables musicians to experiment with sound, change its structure, control its parameters and be creative in a direct, refreshing and unseen way. It uses a tabletop tangible interface, which allows the performers to control the system by manipulating tangible objects and with their fingers.

⁷ [Reactable](#)

Where is the research in tangible computing?

- » **Example 1:** Affordance++, (Lopes et al., 2015)
- » **Example 2:** Shape-shifting displays (Shape Lab)
- » **Example 3:** Project Zanzibar (Microsoft Research)

Discussion Questions

- » Are these visions in *conflict*? What are *opportunities/challenges* associated with each vision?
- » Are there developments that these visions have missed?
- » What mobile/pervasive/tangible technologies do you use?
- » What external resources have you identified in this space?
- » ...
